When stakeholders requested coverage for high pressure hydrogen applications, ASME decided to modify Section VIII Division 3 (Div. 3) rather than to create an entirely new code or to provide that coverage in other ASME pressure vessel codes because the scope of Div. 3 included pressure vessels with design pressures generally above 70 MPa. Vessels with lower design pressures, which may be used ...

Pressure Vessel Codes - an overview | ScienceDirect Topics

The ASME Boiler & Pressure Vessel Code is an American Society of Mechanical Engineers standard that regulates the design and construction of boilers and pressure vessels. The document is written and maintained by volunteers chosen for their technical expertise. The ASME works as an accreditation body and entitles independent third parties to inspect and ensure compliance to the BPVC.

We work to many ASME standards to design and validate pressure vessels, boiler, fittings and piping systems. We have experience designing thousands of vessels and fittings to multiple codes. This Division of Section VIII provides requirements applicable to the design, fabrication, inspection, testing, and certification of pressure vessels operating at either internal or external pressures exceeding 15 psig. Such vessels may be fired or unfired. This pressure may be obtained from an external source or by the application of heat from a direct or indirect source, or any combination thereof. These rules provide an alternative to the minimum requirements for pressure vessels under Division 1 rules. In comparison the Division 1, Division 2 requirements on materials, design, and nondestructive examination are more rigorous; however, higher design stress intensify values are permitted. Division 2 rules cover only vessels to be installed in a fixed location for a specific service where operation and maintenance control is retained during the useful life of the vessel by the user who prepares or causes to be prepared the design specifications. These rules may also apply to human occupancy pressure vessels typically in the diving industry. Rules pertaining to the use of the U2 and UV ASME Product Certification Marks are also included.

The potential development of any nuclear power programme should include a rigorous justification process reviewing the substantial regulatory, economic and technical information necessary for implementation, given the long term commitments involved in any new nuclear power project. Infrastructure and methodologies for the justification of nuclear power programmes reviews the fundamental issues and approaches to nuclear power justification in countries considering nuclear new build or redevelopment. Part one covers the infrastructure requirements for any new nuclear power programme, with chapters detailing the role and responsibilities of government, regulatory bodies and nuclear operator and the need for human resources and technical capability at the national level. Part two focuses on issues relevant to the justification process, including nuclear safety, radiation protection and emergency planning. Current designs and advanced reactors and radioactive waste management are also considered, along with the economic, social and environmental impacts of nuclear power development. Part three reviews the development of nuclear power programme, from nuclear power plant site selection and licensing, through construction and operation, and on to decommissioning. Finally, a series of valuable appendices detail the UK experience of justification, nuclear safety culture and training, and the multinational design evaluation programme (MDEP). With its distinguished editor and expert team of contributors, Infrastructure and methodologies for the justification of nuclear power programmes is an essential reference for international and national stakeholders in this field, particularly governmental, non-governmental and regulatory bodies, nuclear power operators and consultants. Offers a comprehensive analysis of the infrastructure and methodologies required to justify the creation of nuclear power programmes in any country Provides coverage of the main issues and potential benefit linked to nuclear power Reviews the implementation of a nuclear power programme with particular reference to the requirements and methods involved in construction
