Stanley J. Farlow. Most physical phenomena, whether in the domain of fluid dynamics, electricity, magnetism, mechanics, optics, or heat flow, can be described in general by partial differential equations. Indeed, such equations are crucial to mathematical physics. Although simplifications can be made that reduce these equations to ordinary differential equations, nevertheless the complete description of physical systems resides in the general area of partial differential equations.

Since the values of r are pure imaginary, we know that $x_1(t)$ and $x_2(t)$ will oscillate with angular frequencies $w_1 = \text{Im}\{r_1\}$ and $w_2 = \text{Im}\{r_2\}$, that is, $w_1 = \sqrt{k/m}$, $w_2 = q(k + 2K)/m$. The positions of the oscillating masses in general contain time dependencies of the form $\sin w_1 t$, $\cos w_1 t$, and $\sin w_2 t$, $\cos w_2 t$. 86 CHAPTER 6.
