~~Refactoring—Martin Fowler~~

In computer programming and software design, code refactoring is the process of restructuring existing computer code—changing the factoring—without changing its external behavior. Refactoring is intended to improve the design, structure, and/or implementation of the software, while preserving its functionality. Potential advantages of refactoring may include improved code readability and reduced complexity; these can improve the source code's maintainability and create a simpler, cleaner ...

Refactoring

In other words, refactoring, though done on source code, has the objective of improving the design that the code implements.

Therefore, the basic principles of design guide the refactoring process. Consequently, a refactoring generally results in one or more of the following: 1. Reduced coupling 2. Increased cohesion 3.

~~Refactoring: Improving the Design of Existing Code~~

Refactoring is the process of changing a software system in such a way that it does not alter the external behavior of the code yet improves its internal structure. It is a disciplined way to clean up code that minimizes the chances of introducing bugs. In essence when you refactor you are improving the design of the code after it has been written.
